Report on the Quality of Land Surface Observations in Region II
(No. 58)
July – December 2019

Summary

In its role as a Lead Center, RSMC Tokyo has issued the 58th report on the land surface observation quality monitoring for the period from July to December 2019. The report includes a consolidated list of stations suspected of producing low-quality observation data.

As a result of monitoring, five stations (52866, 54027, 38947, 41263, 41265) were excluded from the consolidated lists of the previous report (January – June 2019), and ten stations (40633, 40700, 40835, 40954, 41573, 42083, 42147, 42295, 42299, 47037) were newly added to the lists.

1. Introduction

Pursuant to Paragraph 22 of Attachment II.7 of the Manual on the Global Data Processing and Forecasting System (WMO No. 485), the Regional Specialized Meteorological Center (RSMC) Tokyo was designated by the President of the Commission for Basic Systems (CBS) as a Lead Center for monitoring the quality of land surface observations (i.e., SYNOP) in Region II in March 1991. The Center is responsible for monitoring the quality of land surface observations and maintaining consolidated lists of stations suspected of reporting low-quality observation data together with adequate evidence. The lists are to be passed on to the WMO Secretariat and monitoring centers participating in this activity as well as to Members of Regional Association (RA) II for their reference.

2. Monitored Data

Monitored surface observation data are obtained at 00, 06, 12 and 18 UTC and collected at RSMC Tokyo before the data cut-off time, defined as the end of the period in which observation data are gathered for operational analysis. The cut-off times for Japan Meteorological Agency (JMA) global analysis are shown in Table 1.

Table 1 Data cut-off times for JMA global analysis.

Analysis time	Data cut-off time
00 UTC	11:50 UTC
06 UTC	13:50 UTC
12 UTC	23:50 UTC
18 UTC	01:50 UTC

The observation elements monitored are (1) station level pressure, (2) mean sea level pressure and (3) geopotential height, hereafter referred to as SLP, MSLP and GZ, respectively. In accordance with the Manual on Codes (WMO No. 306) Volume II, GZ data on an agreed standard pressure level are reported at the stations whose elevation is higher than 800 m. Standard pressure levels defined in line with station elevation are shown in Table 2.

Table 2 Elevation of stations reporting GZ data and corresponding standard pressure levels.

Station elevation (m)	Pressure level (hPa)
800 - 2,300	850
2,300 - 3,700	700
Higher than 3,700	500

The numbers of stations reporting SLP, MSLP and/or GZ data in Region II are shown in Table 3, and the locations of these land surface stations are shown in Figure 1.

Table 3 Numbers of stations reporting SLP, MSLP and/or GZ data in Region II

Element	Number of stations
SLP	1733
MSLP	1900
GZ	86

3. Monitoring Methods

The three items described below are examined for each element.

- (i) Monthly statistics on observation deviations from the most recent forecast of JMA ' s global model (referred to as first-guess values) (observation minus guess, hereafter referred to as O-G) and on related trends over the monitoring period
- (ii) Monthly statistics on deviations from values observed at surrounding stations
- (iii) Reference information from other monitoring centers

Information on the latitude, longitude and altitude of each station is necessary for calculation of first-guess values. Such data for land surface station locations is retrieved from the surface-based observing system component of the Observing Systems Capability Analysis and Review Tool (OSCAR/Surface)* , replacing WMO No. 9, Volume A.

*<https://oscar.wmo.int/surface/index.html#/>

The monitoring procedure has two steps as outlined below.

(1) Exclusion of data with gross errors from the statistical calculation sample

The following thresholds are applied for the gross error check in the first step:

$$\begin{aligned}|O-G| &\geq 15 \text{ hPa for SLP and MSLP} \\ |O-G| &\geq 100 \text{ gpm for GZ}\end{aligned}$$

Gross error data are excluded from the calculation of BIAS (the mean of O-G) and SD (the standard deviation of O-G).

(2) Identification of suspect stations

When the total number of observations (NOBS) is 184 or more, the next criteria are applied:

- BIAS	$ BIAS \geq 3 \text{ hPa for SLP and MSLP}$
- SD	$ BIAS \geq 30 \text{ gpm for GZ}$
	$SD \geq 5 \text{ hPa for SLP and MSLP}$
	$SD \geq 40 \text{ gpm for GZ}$
- Percentage of gross errors (PGE)	$PGE \geq 25\%$

Stations with even one statistic exceeding the threshold are considered suspect.

Note:

- (i) The quality of observation data from stations is not checked when the NOBS value is less than 184 or the difference between H and HM is greater than 1,000 m. MSLP reports are also not checked for stations located at altitudes higher than 1,000 m above sea level.
- (ii) In case of low quality of the first-guess field, those statistics can exceed the threshold and the stations are listed in the consolidated list. To avoid such situations, statistics of surrounding stations and information from other monitoring centers are also used to judge whether the quality of the station's first-guess field value is appropriate.

4. Monitoring Results

4.1 Consolidated list of suspect stations throughout the period

Table 4 List of suspect land surface stations during the period from July to December 2019

WMO IDENT	LAT (N)	LON (E)	H (m)	HM (m)	ELEM	NOBS	PGE (%)	SD	BIAS	RMS

					MSLP	732	0	1.4	-4.0	4.2

IRAQ

40633 - Positive bias of O-G at the mean sea level (Figure 39)

The positive bias of O-G at the mean sea level appears to have been observed since July 2019.

IRAN, ISLAMIC REPUBLIC OF

40700 - Negative bias of O-G at the station level (Figures 10 and 40)

40835 - Negative bias of O-G at the station level (Figures 41 and 42)

AFGHANISTAN

40954 - Negative bias of O-G at the station level (Figures 6 and 43)

PAKISTAN

41573 - Positive bias of O-G at the station level (Figures 44 and 45)

INDIA

42083 - Positive bias of O-G at the station level (Figures 44 and 46)

42147 - Positive bias of O-G at the station level (Figures 18 and 47)

42295 - Positive bias of O-G at the station level and at 850 hPa (Figures 48 and 49)

42299 - Negative bias of O-G at the station level (Figures 48 and 50)

DEMOCRATIC PEOPLE'S REPUBLIC OF KOREA

47037 - Negative bias of O-G at the station level and at the mean sea level (Figures 28 and 51)

4.3 Stations improved and excluded from the previous consolidated list

CHINA

52866 - Since the station's elevation above sea level was changed from 2296 to 2435 m in December 2019 in JMA's records based on OSCAR/Surface, the negative bias of O-G at the station level has improved. (Figure 52)

54027 - Since the station's elevation above sea level was changed from 485 to 589 m in December 2019 in JMA's records based on OSCAR/Surface, the negative bias of O-G at the station level has improved. (Figure 53)

4.4 Stations removed from the previous consolidated list

TAJIKISTAN

38947 - Although station 38947 still displays negative biases of O-G at the station level, it was removed from the consolidated list because the biases did not exceed the threshold. (Figure 54)

OMAN

41263 - No reports during the period

41265 - Directorate General of Meteorology, Oman informed us the correct barometer height at this station. Therefore it was removed from the consolidated list.

5. Possible Causes of Remarkable and Sustained Biases

The following are possible causes of remarkable and sustained biases

- (i) The barometer used for observation is not correctly calibrated.
- (ii) The latitude, longitude or altitude of the station in OSCAR/Surface has not been updated in a timely and appropriate manner. This could result in remarkable biases because it may cause incorrect calculated first-guess field values.
- (iii) Biases are specific to the NWP model used in quality monitoring.

Note: Model biases are likely to appear in relatively large areas.

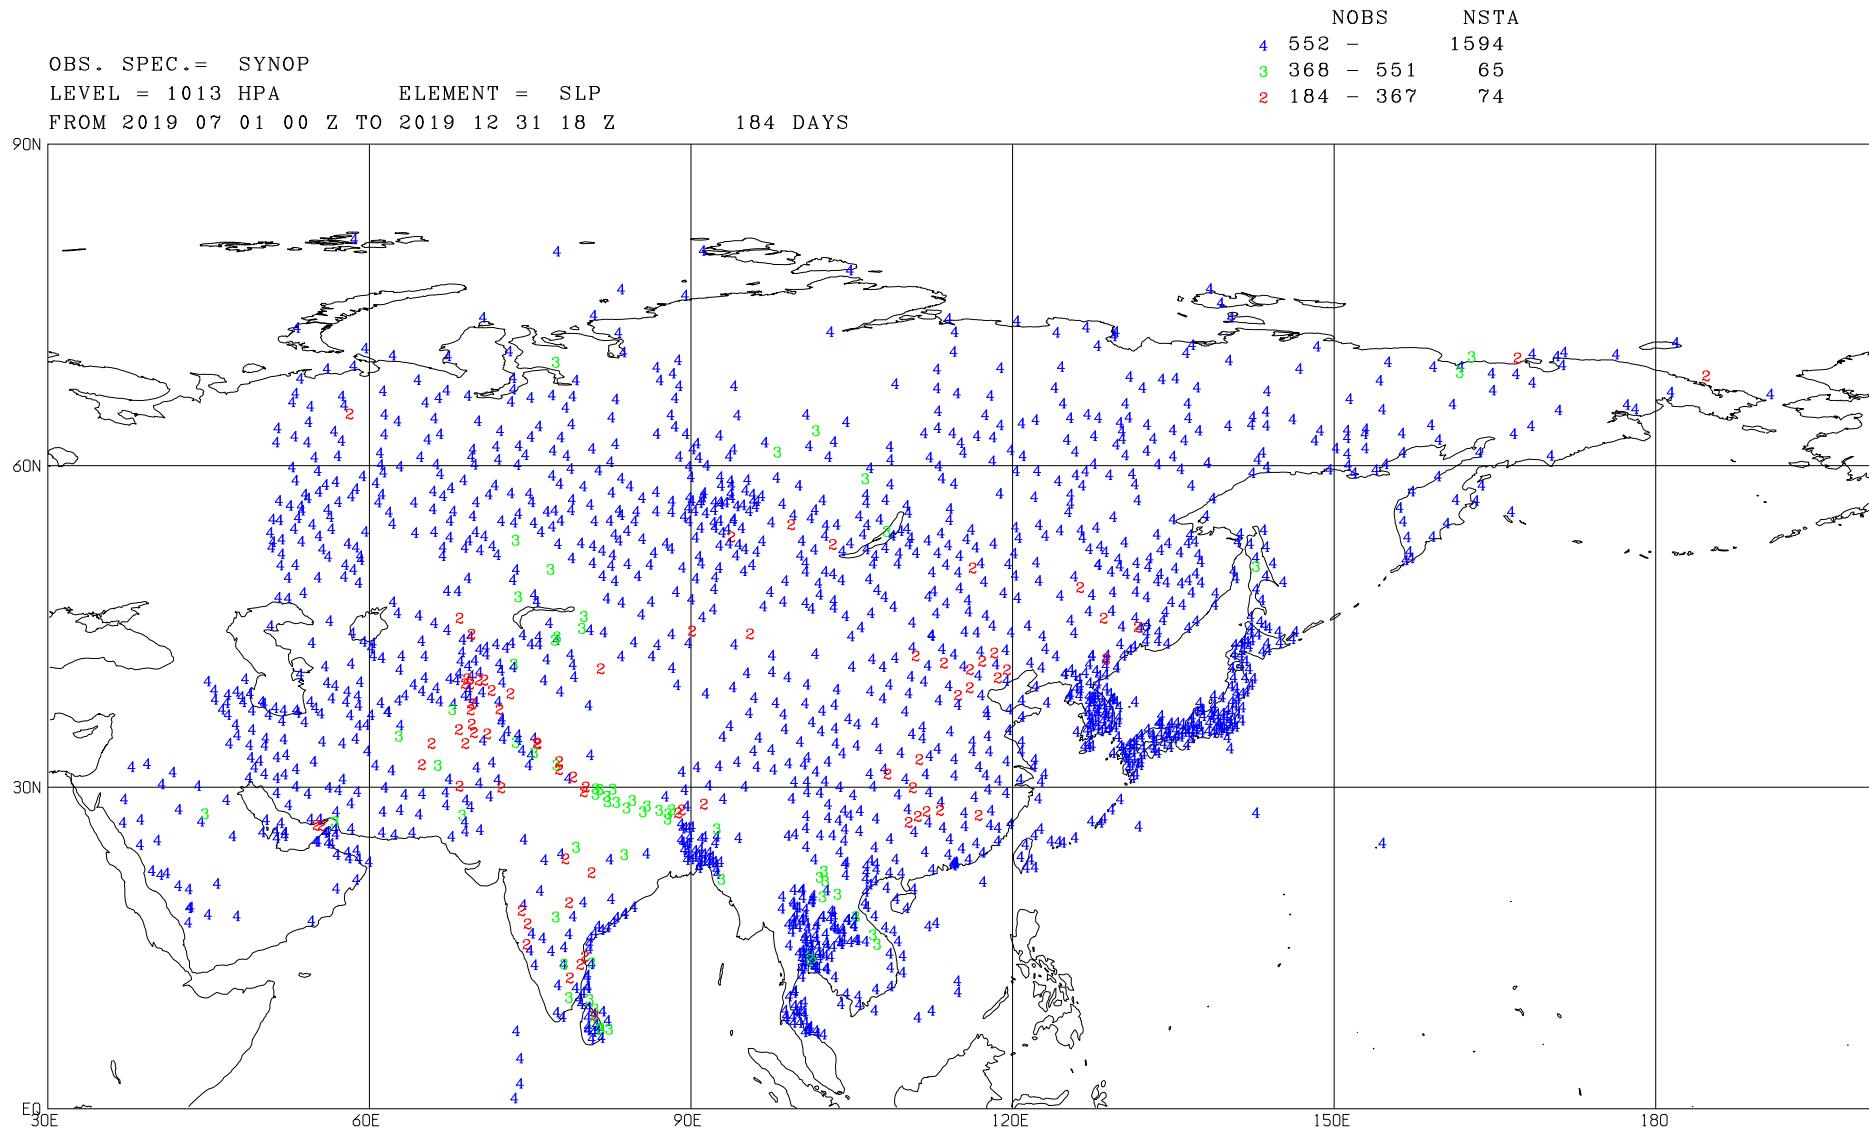

Figure 1(a) Location of all land surface stations reporting station level pressure (SLP) observations in Region II over the six-month period from July to December 2019. Numbers (2, 3, 4) show the total number of observations (NOBS) received at RSMC Tokyo. The total numbers of stations (NSTA) reporting SLP are shown at the top of the figure.

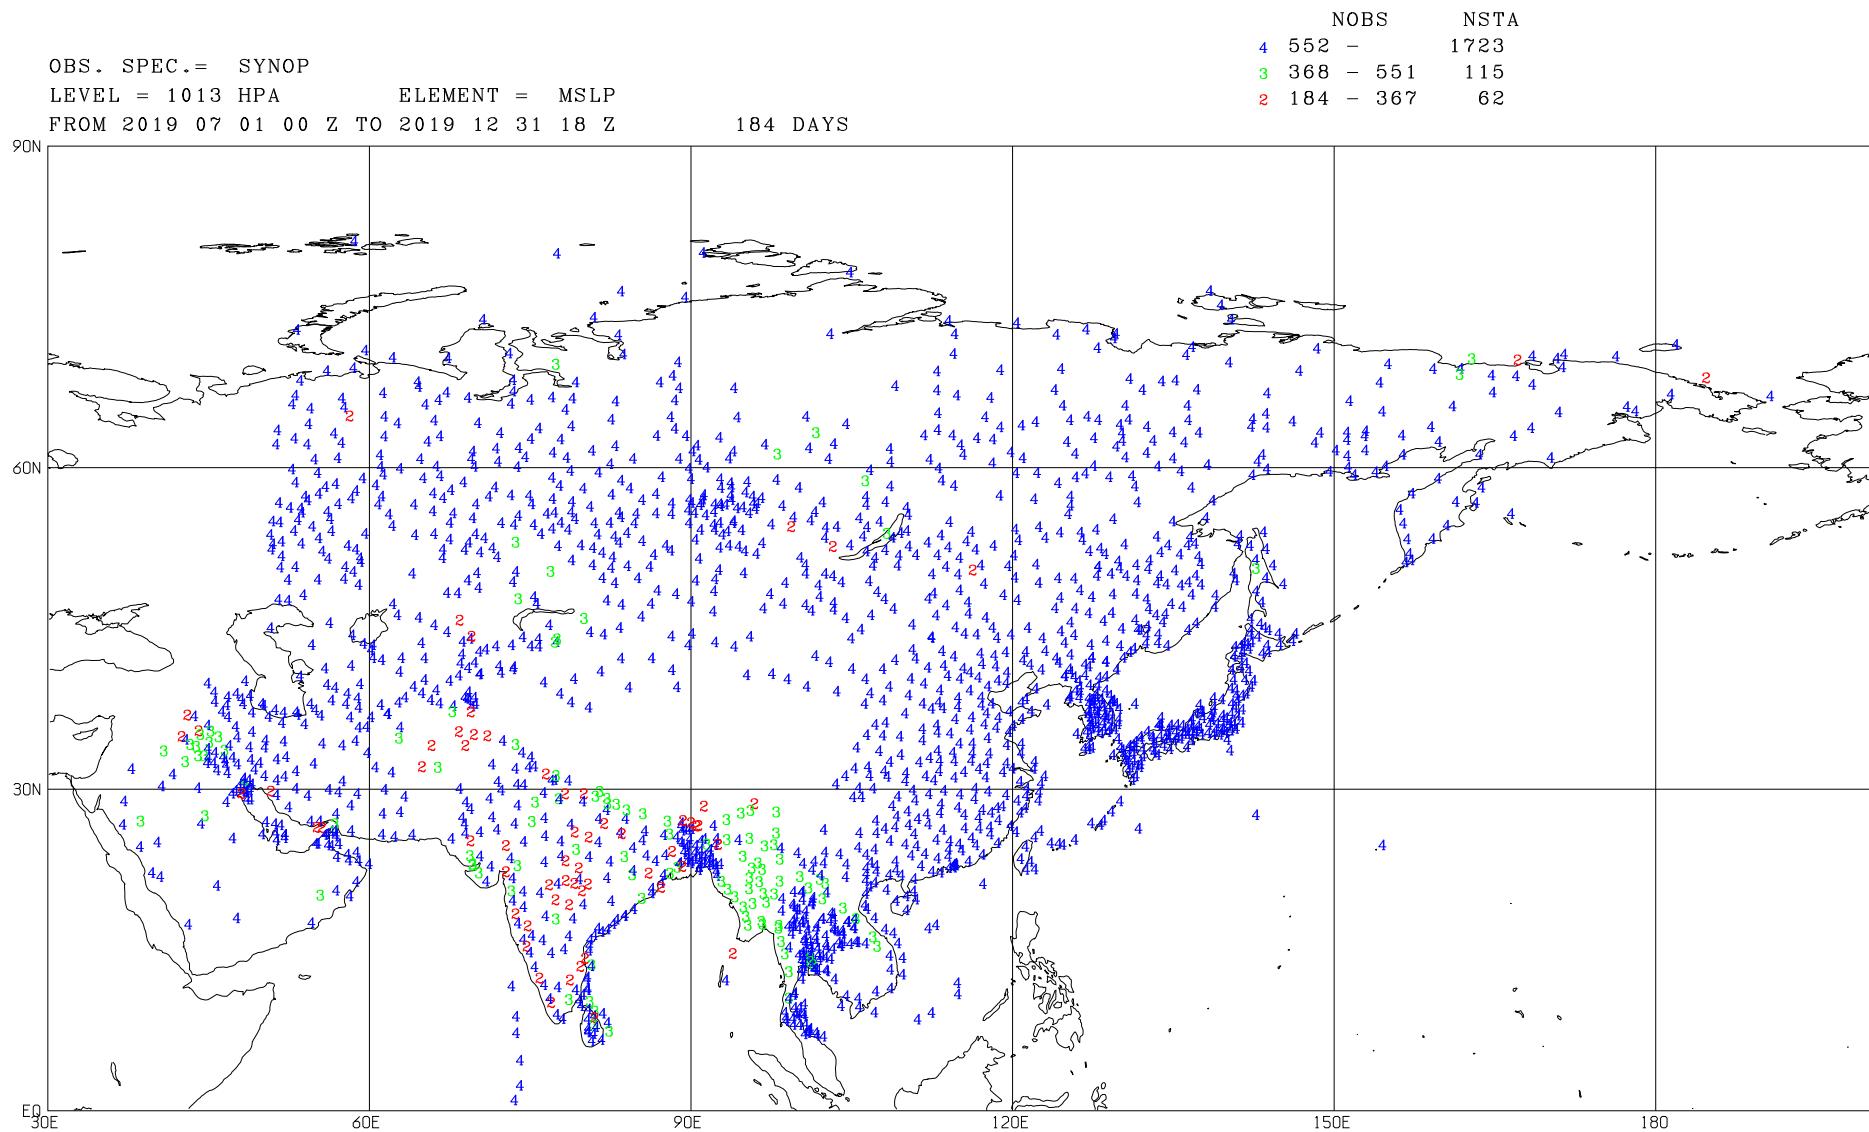

Figure 1(b) Location of all land surface stations reporting mean sea level pressure (MSLP) observations in Region II over the six-month period from July to December 2019. Numbers (2, 3, 4) show the total number of observations (NOBS) received at RSMC Tokyo. The total numbers of stations (NSTA) reporting MSLP are shown at the top of the figure.

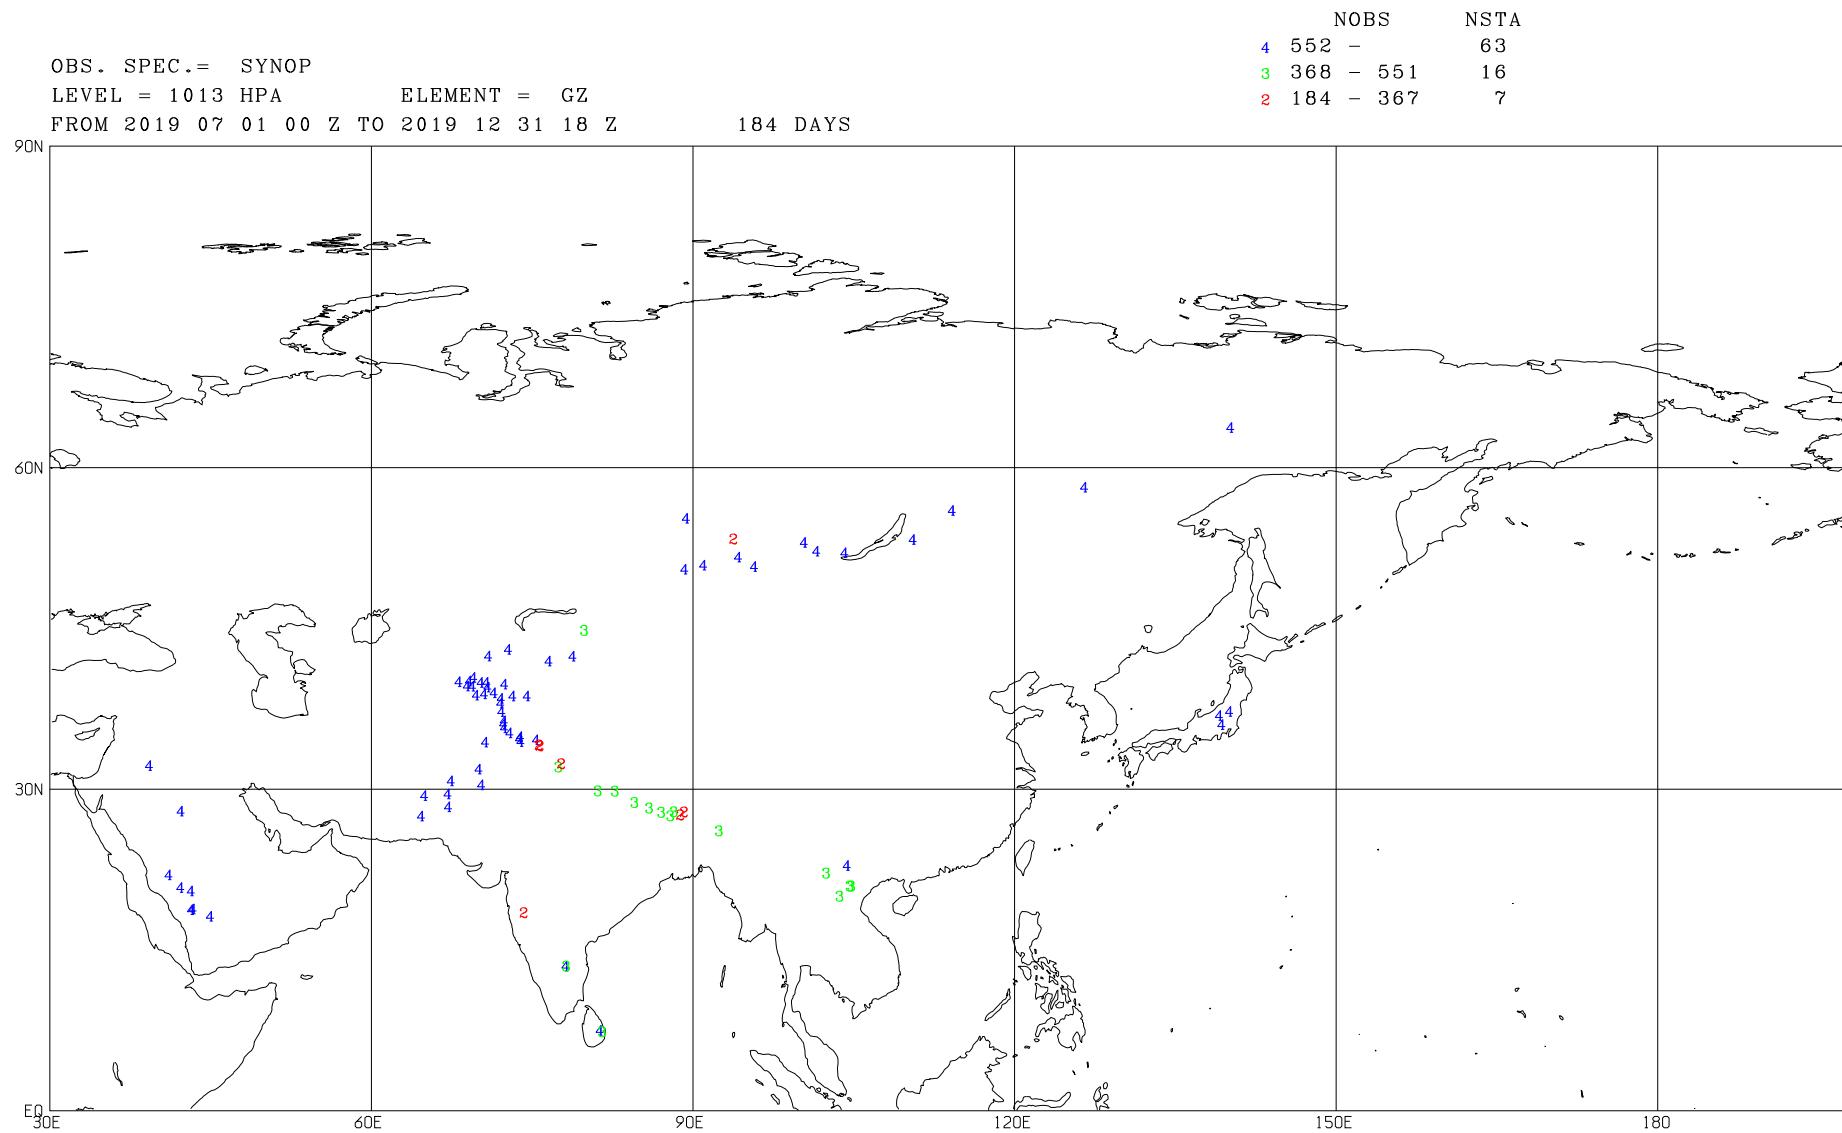

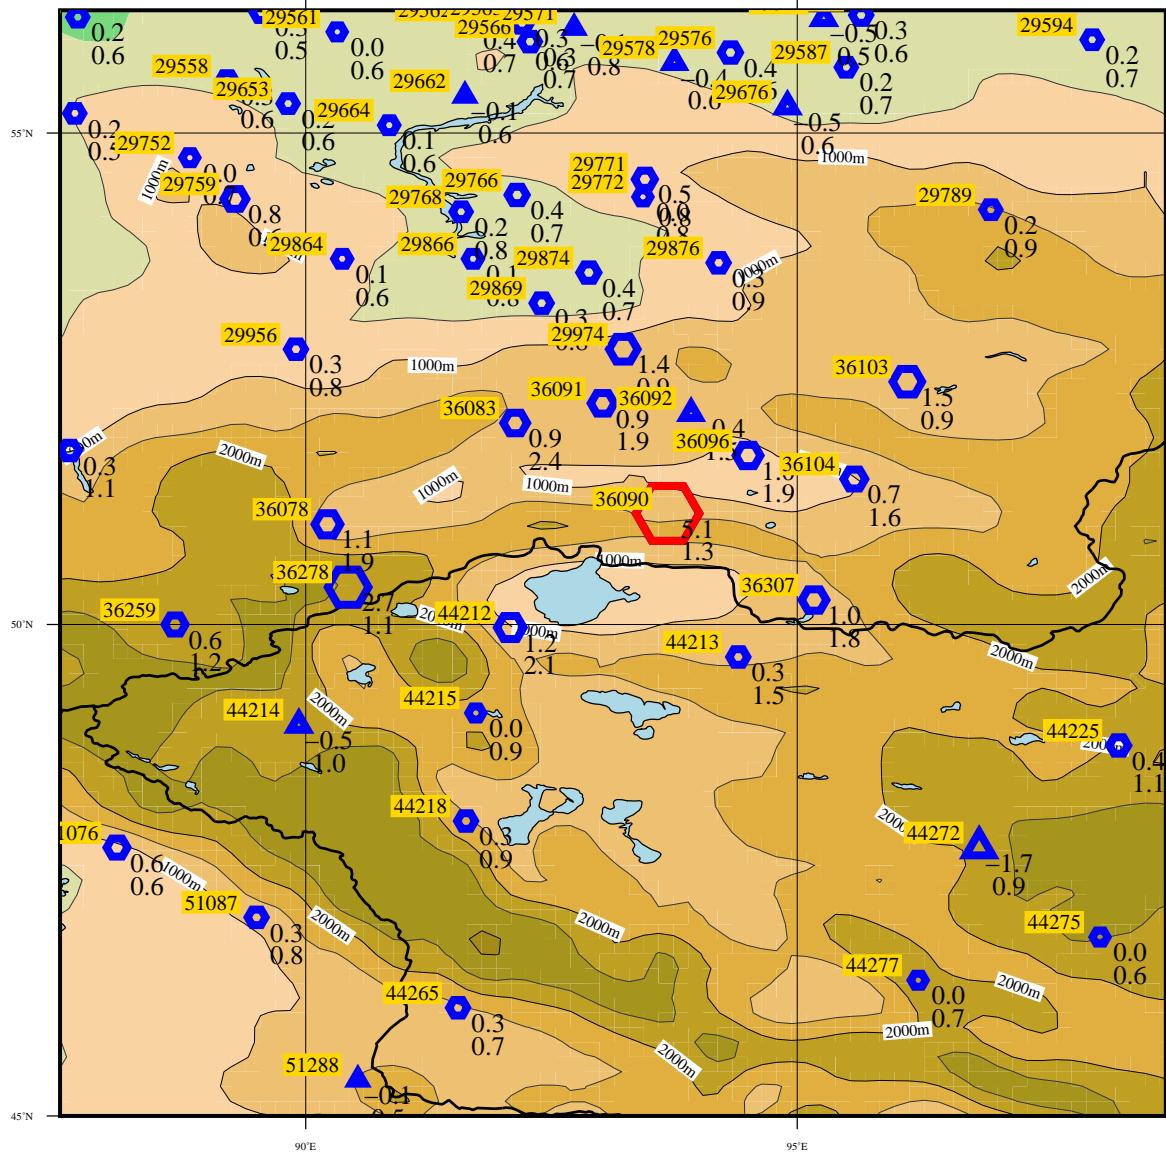

Figure 1(c) Location of all land surface stations reporting geopotential height (GZ) observations in Region II over the six-month period from July to December 2019. Numbers (2, 3, 4) show the total number of observations (NOBS) received at RSMC Tokyo. The total numbers of stations (NSTA) reporting GZ are shown at the top of the figure.

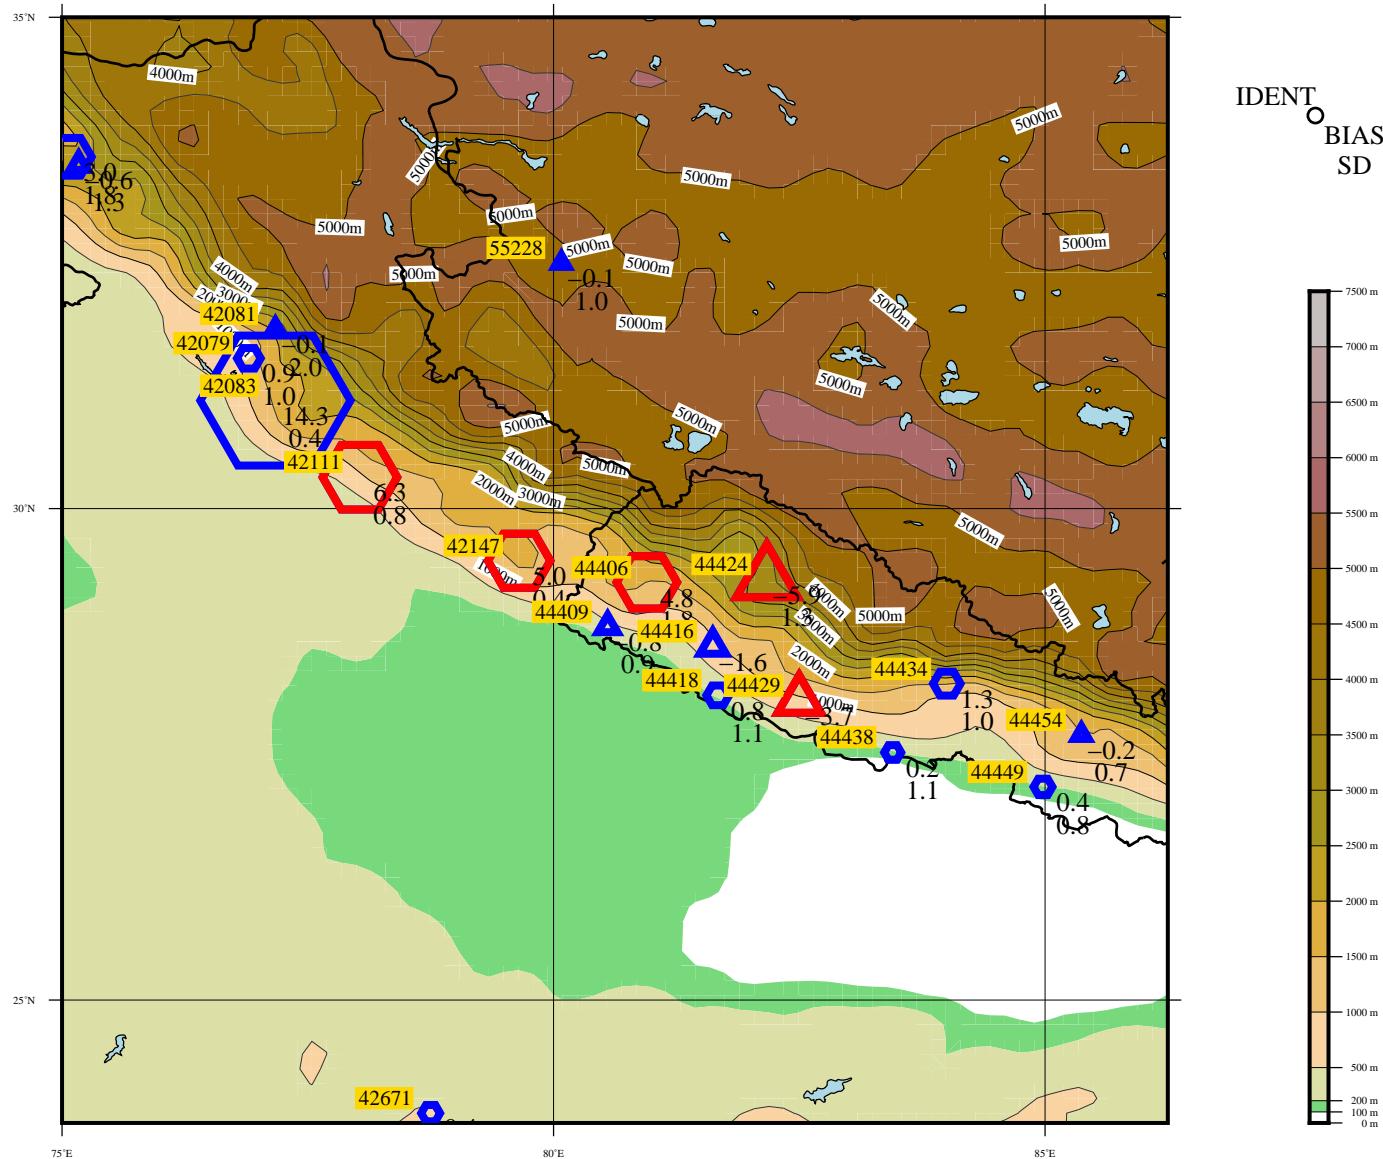

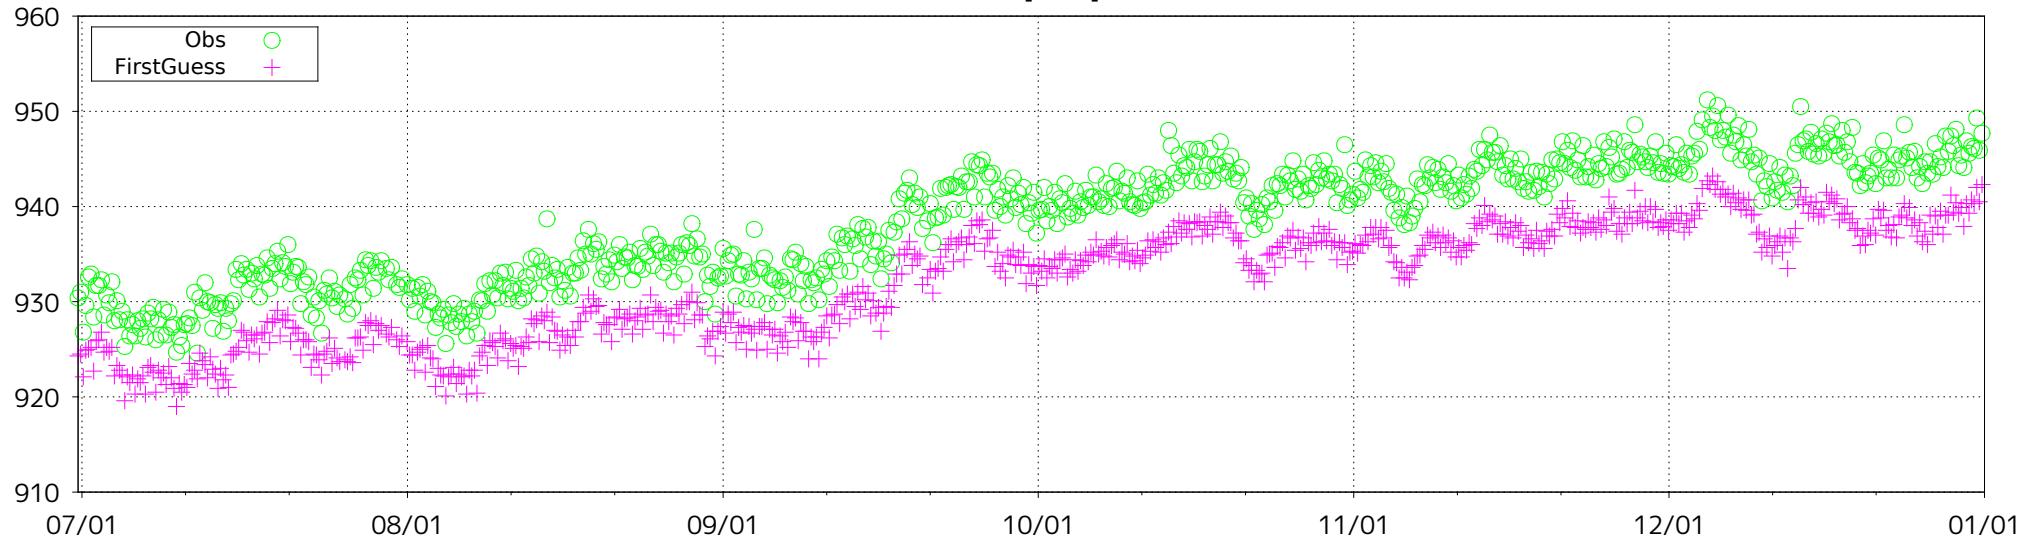

Figure 18 BIAS and SD of SLP for station 42111, 42147, 44406, 44424, 44429 (red) and surrounding stations (blue).

The number to the upper left of each symbol is the WMO IDENT, and those to the lower right are the values of BIAS and SD.

The size of each symbol is proportional to the value of BIAS, with hexagonal forms representing positive bias and triangular forms representing negative bias.

ID: 42111 (lat: 30.3N, lon: 78.0E)
